1. Materiali e attrezzi

1.1 Scelta della pistola

- Per la scelta della pistola bisogna tenere conto die seguenti punti:
 - distribuzione dei pesi
 - possibilità di modificare in modo semplice il meccanismo dello scatto
 - possibilità di regolare i congegni di mira
 - possibilità di regolazioni e adattamento dell'impugnatura.
- Con la pistola ad aria il pallino deve raggiungere la seguente velocità:
 - Aria compressa ca. 150 m/s - 155 m/s
 - Pistola a CO₂ ca. 160 m/s - 170 m/s
- La scelta della canna e delle munizioni è necessaria qualora si voglia raggiungere un'alta prestazione.

1.2 Impugnatura

- La massima dice: l'arma spara e il calcio (l'impugnatura) centra.
- Nella lavorazione dell'impugnatura contano in primo luogo le norme del regolamento sportivo di tiro della propria federazione.

1.1.1 Key points in the processing:

- Grip will always be adapted to the hand **from the back to the front**.
- The **line of sight** (eye-tacca- viewfinder - target) runs ideally over the hand and over the line median of the arm.
- **support base of the hand** to the wrist!
- base of the thumb as a point of lateral block and at the same time the 'handle to be put to **the center of** the hand **snuff** (between thumb and forefinger)
- **width of** the space of 'grip between thumb and index determined by the extent of snuffbox
- **thumb and forefinger** adhere **parallel** to the handle
- **thumb and index** have the **same** height
- fit the palm of the hand as follows:
- hands broad, tough - thin handle
- lean and thin hands - normal or wide grip
- The **central phalanges** (falangine) are bent at a right angle (**90 degrees**) to the axis of the barrel and at the **center** of the trigger
- **Middle, ring** hold the weapon
- The **thumb** serves to stabilize
- L '**index** may slightly adhere to' handle with the top joint
- The **first and second phalanx** (Falanghina and falangetta) do not touch either the gun or the handle!
- The **first joint of** the coupling point (end of the first race) must be at right angles (90 degrees) respect to the axis of the barrel

1.3 Lavorazione dell'impugnatura – Passaggi pratici

1.3.1 IMPUGNATURE – Linea di mira

Put the gun in the middle of the hand

Line of sight from the front

Line of sight from above

Line of sight from behind

Fundamental points:

Put the gun in the middle between thumb and forefinger

The line of sight notch - Viewfinder runs over the center of the back of the hand, along forearm up eye

Finger and thumb are parallel to 'handle'

Position of head straight towards the 'grip'

1.3.2 IMPUGNATURE – La mano che impugna l'arma senza impugnatura

HANDLES - The hand that holds the weapon without handle

front view

Side View

Direct view from below

Side view from behind

Side view

Fundamental points:

- Thumb and index finger parallel
- Thumb and index have about the same height
- The falangine (middle phalanges) of the middle, ring and little fingers are bent at an angle rectum (90 degrees) with respect to the hand
- Bend naturally the index until the first phalanx (fingertip) is at right angle (90 degrees) with respect to the hand

1.3.3 IMPUGNATURE – Base d'appoggio della mano

Support base of the hand stretched with plastic wood

The hand support base copied and secured with two screws

Cradle of optimal / air pistol hand

The hand support base too short / sporting gun

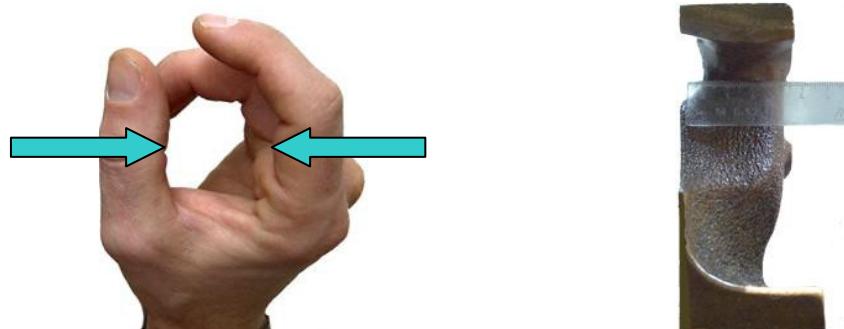

The hand support base Optimal / sporting gun

Fundamental points:

- Typically the original grips of companies are too short
- The support base of the hand can be stretched to the wrist
- The extension gives the hand more stability and greater pressure from below

1.3.4 IMPUGNATURE – Ampiezza tra pollice e indice

Return the width between your thumb and forefinger (parallel) on the handle

Space of 'handle between thumb and forefinger too wide

Of 'handle space between thumb and forefinger too strict

Processing on the space for the snuffbox

Fundamental points:

- The width of the space of 'grip between thumb and index is determined by hand size
- The space of 'grip between thumb and index finger and thumb will be such that adhere parallel to the handle itself

1.3.5 IMPUGNATURE – Base d'appoggio della mano

The base of the hand has much room in the 'grip'

View from above towards the base of hand

Optimum tight lateral support base for the hand

Fundamental points:

- In the lower part of the 'grip' there must be sufficient space for the base of the hand
- The rear side support for the hand should be kept narrow - line of sight straight

1.3.6 IMPUGNATURE – Posizione delle dita

The surface of the middle finger support inclined / light contours for the fingers

Optimal support of the middle finger / phalanges central (falangine) are bent at an angle rectum (90 degrees) to the axis of the barrel and at the center of the trigger

The index finger is the first phalanx free

The bent index finger naturally

Thumb and index are about the same height and parallel adhere to 'handle'

Fundamental points:

- Thumb and index are about the same height
- Thumb and forefinger adhere parallel to 'handle'
- The first two phalanges of the index does not touch the handle
- The third phalanx can lightly touch the handle
- The index is naturally folded so that the first joint is at a right angle (90 degrees) respect to the axis of the barrel
- The upper part of the middle finger on the handle must be used in all its width
- The central phalanges (falangine) of the middle, ring and little fingers are bent at right angles (90 ° degrees) to the axis of the rod and the center of the trigger

1.3.7 IMPUGNATURE – Cause di errori

Causes of errors

The too big handle - index and back of the handle have too much space. Too raised thumb

The fingers are not positioned centrally with respect to the trigger.
The inner base of the hand too little space in the handle

Line of sight is not centered

The fingers have too space and wrap around too the handle

Based rear side support too thick Space for snuff sharp left, too wide to the right

Based rear side support too thick

Fundamental points:

- Too big handle - The fingers and the back Hand have too much space
 - Holding a too high intake
- The central phalanx are not in axis with respectt to the trigger
 - The handle is not held so uniform
- The inner base of the hand has too little in the handle area
 - The handle is not held so uniform
- Line of sight is not aligned
 - Articulation of the wrist is contracted
- The fingers wrap around the handle too
 - At the time of the release can take place a tear
 - Line of sight is not centered
- Based rear side support too thick
 - The handle is not held so uniform
- Space for snuff too tight
 - The handle is not held so uniform

1.4 Shooting Clothing

If possible, use always **the same** clothing shooting
Shooting clothing **is not tight** and that allows good breathing
Sturdy shoes with a flat, **thick** sole
The interior of the shoe possibly not too soft
Headphones are "required" even in the compressed air
A hat **with a visor** in equipment draft should never be overlooked
